

Core A' — what is built

every module and device badged by the spec §11 phase that writes it · **only what the reduction keeps is drawn**, so this is not fig 1c's canvas
9 of 19 phases merged (#41–#50) · as of 2026-09-10

edge kinds — what actually crosses each interface		executes since
	mass · shared state, continuous; gradients cross inside the ODE block	✓ P1 · #42
	currency · routed via the pool node	✓ P1 · #42
	deferred counter · CME accrues a cost, the hook debits it one step later	✓ P3 · #44
	catalytic · counts enter rate laws as parameters, no mass flows	✓ P3 · #44
	rate constant · pools re-enter the CME at the 60 s rebuild, piecewise-constant	✓ P4 · #45
	volume · counts set surface area, which sets V, which rescales concentrations; the inbound half — geometry into an ODE rate law — arrives with 5b	✓ P5 · #46
	clamped · a real dependence replaced by a constant	□ declare-only
	intra-block · <i>not a CouplingEdge</i> — a jump module reads or writes a declared peer's state, gated on written states , which spec §12 (2026-09-04) settled	✓ P2 · #43
6 of 7 kinds run. The seventh validates, resolves and reports, but nothing executes it.		

what is built — every badge in this figure is parsed from spec §11, never typed	
✓ P7 · #49	merged · every task in the phase is ticked, and the PR is the record of what it cost
□ P8	not written · the number is the spec §11 phase that writes it
	amber · the module survives the Core A' reduction in altered form — a different axis, and not a claim about code
9 of 19 phases have merged, and every one of them is framework. 6 of 7 edge kinds execute; not one box in this figure exists in code. 76 of 150 tasks ticked.
